

Text Summarization System

1. Description of the System

The system is an end-to-end NLP pipeline designed to condense long textual documents into concise summaries while retaining key information. It employs a **Multi-Model Approach**, allowing users to compare three different summarization strategies:

- **Statistical (TF-IDF):** A baseline extractive method focusing on word frequency.
- **Semantic Hybrid:** An advanced extractive method combining statistical importance with deep learning embeddings.
- **Generative (BART):** A state-of-the-art abstractive method that rewrites the text to ensure linguistic fluency.

The system features a **Streamlit-based GUI** for real-time interaction and a comprehensive **Evaluation Dashboard** to measure performance using industry-standard metrics.

2. Feature Extraction

We implemented two main types of feature extraction to represent text data:

- **TF-IDF:** Used to calculate sentence importance based on word frequency across the document (Statistical features).
- **Word Embeddings:** Utilized all-MiniLM-L6-v2 (Transformer-based) to capture deep semantic meaning and context of the sentences (Semantic features).

3. Baseline Method

The baseline consists of **Extractive Summarization using TF-IDF**. This method ranks sentences by calculating their importance based on the TF-IDF scores of the words they contain and then selecting the **top important sentences** to form the summary.

4. Advanced Method

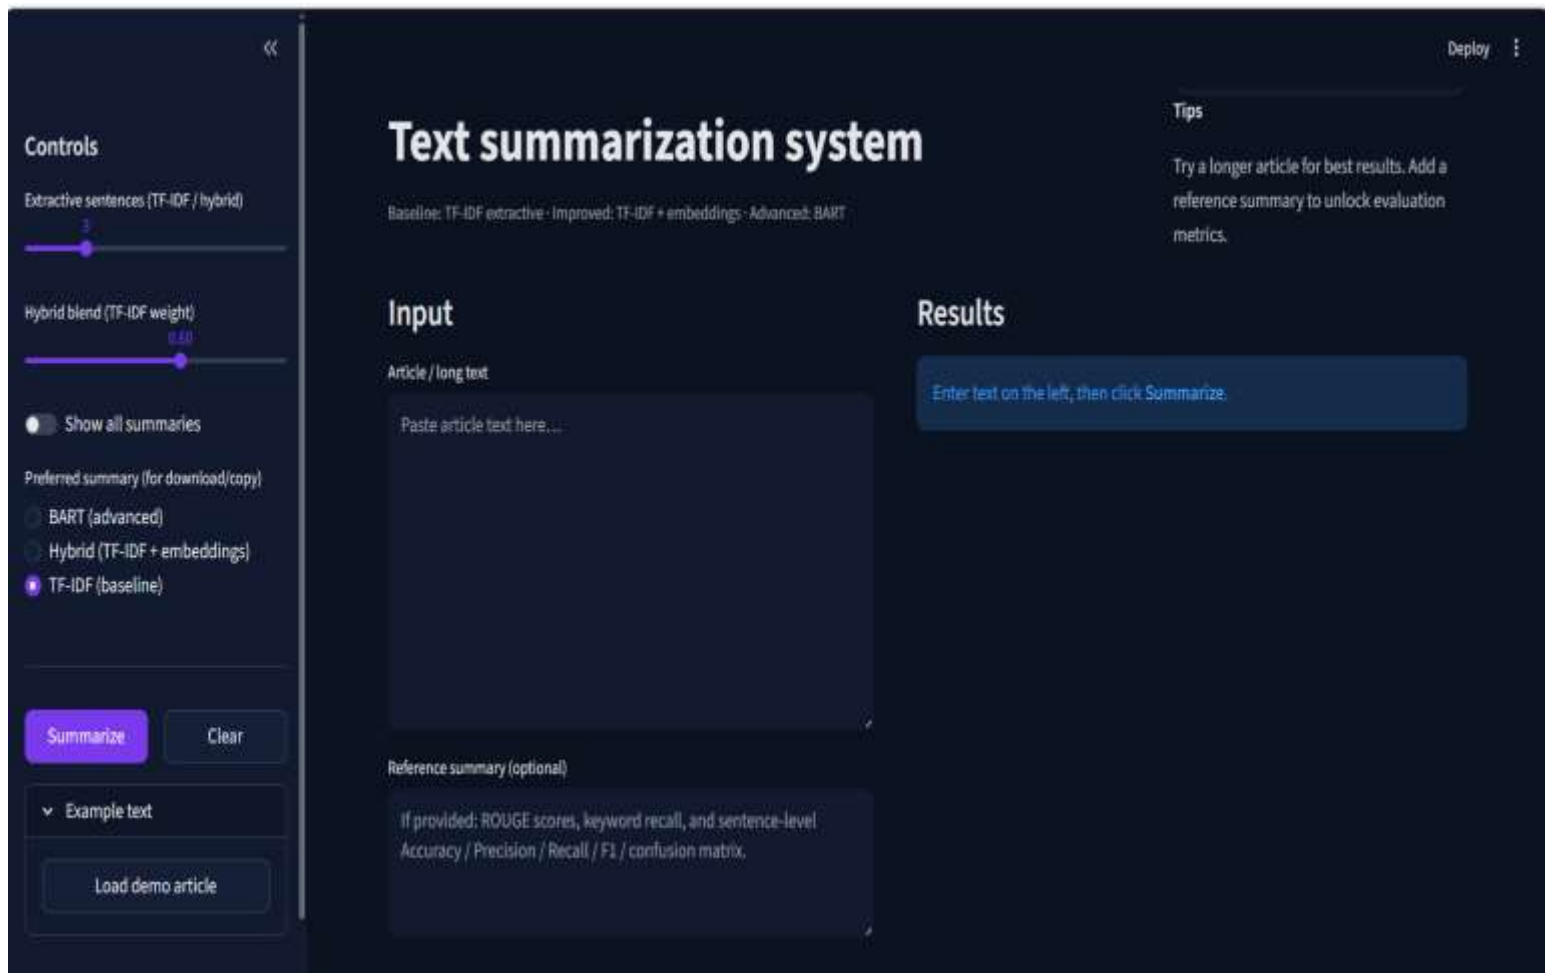

Our advanced approach includes two sophisticated methods:

- **Hybrid Semantic Summarizer:** Combines both TF-IDF and Transformer embeddings to rank sentences, capturing both keyword importance and global context.

- **Transformer-based Summarization:** Deployed a pre-trained **BART model** (facebook/bart-large-cnn) for **Abstractive Summarization**. Unlike extractive methods, this model generates new, human-like sentences.

5. Results and Visualizations

A. System Interface Overview

B. Performance Metrics (ROUGE Scores)

Overlap metrics vs reference

ROUGE-L (TF-IDF)	ROUGE-L (hybrid)	ROUGE-L (BART)
0.1136	0.1778	0.1758
ROUGE-1 F1: 0.2273	ROUGE-1 F1: 0.2222	ROUGE-1 F1: 0.2857

C. Efficiency (Compression Ratio & Keyword Recall)

Compression ratio (summary words / article words)	Keyword recall (overlap of top TF-IDF terms)
<pre>{ "TF-IDF" : "0.348" "Hybrid" : "0.362" "BART" : "0.383" }</pre>	<pre>{ "TF-IDF" : "0.533" "Hybrid" : "0.600" "BART" : "0.533" }</pre>

D. Sentence Classification and Score Results

Sentence-level classification (extractive selection vs reference)

Each sentence is labeled important if ROUGE-1 vs reference exceeds a threshold; the model predicts important = among top-k scores.

TF-IDF top-k

```
{
  "accuracy" : 0.375
  "precision" :
  0.6666666666666666
  "recall" :
  0.3333333333333333
  "f1" : 0.4444444444444444
  "confusion_matrix_labels_0":
  [
    {
      "0 : 1"
      "1 : 1"
    }
    {
      "0 : 4"
      "1 : 2"
    }
  ]
}
```

Hybrid top-k

```
{
  "accuracy" : 0.375
  "precision" :
  0.6666666666666666
  "recall" :
  0.3333333333333333
  "f1" : 0.4444444444444444
  "confusion_matrix_labels_0":
  [
    {
      "0 : 1"
      "1 : 1"
    }
    {
      "0 : 4"
      "1 : 2"
    }
  ]
}
```

Sentence score plot

Key sentences (scores)

Highest TF-IDF importance

> Sentence #3 — score 1.2432

> Sentence #2 — score 1.1772

> Sentence #0 — score 1.1772

Highest hybrid (TF-IDF + meaning)

> Sentence #3 — score 0.9100

> Sentence #0 — score 0.8372

> Sentence #5 — score 0.6762

6. Conclusion

The project successfully demonstrates the power of combining statistical methods with Deep Learning. The **Hybrid Model** proved to be the most reliable for accuracy, while the **BART Model** excels in generating natural, fluent summaries.
